The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a cDNA provided in the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                       their

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA construction of the protein encoded by construction of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-cappi method. The primers enable the production of the full length cDNA easilowithout any special methods. The present sequence was used in vithout any special methods. The present sequence was used in homology searches to identify the clone.

Note: The sequence data for this patent did not form part of the printe specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           94
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  48

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1, Application US/08474933;
Patent No. 5866410
GENERAL INFORMATION:
APPLICANT: Ryan, Michael J.
APPLICANT: Lotvin, Jason A.
APPLICANT: Strathy, Nancy
APPLICANT: Fantini, Susan E.
TITLE OF INVENTION: Cloning of t.
TITLE OF INVENTION: useful there
NUMBER OF SEQUENCES: 1
CORRESPONDENCE ADDRESS:

FUNCTION: CATALYZES THE O-SULFATION OF TYROSINE RESIDUES VACIDIC MOTIFS OF POLYPEPTIDES (BY SIMILARITY).

CATALYTIC ACTIVITY: 3'-phosphoadenylylsulfate + protein tyansine 3',5'-bisphosphate + protein tyrosine-O-sulfate subcellular Location: Type II membrane protein. Golgi memb similarity).

SIMILARITY: BELONGS TO THE PROTEIN SULFOTRANSFERASE FAMIL:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEMBRANE

FUNCTION: CATALYZES THE O-SULFATION OF TYROSINE RESIDUES W.
ACIDIC MOTIFS OF POLYPEPTIDES.
CATALYTIC ACTIVITY: 3'-phosphoadenylylsulfate + protein typadenosine 3',5'-bisphosphate + protein tyrosine-O-sulfate.
SUBCELLULAR LOCATION: Type II membrane protein. Golgi membranilarity).
SIMILARITY: BELONGS TO THE PROTEIN SULFOTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and

Evol. 15:157-164(2000).

FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

COFACTOR: TWO HEME GROUPS (B562 AND B566) WHICH ARE NOT COVALL BOUND TO THE PROTEIN (BY SIMILARITY).

SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

-!- FUNCTION: CATALYZES THE O-SULFATION OF TYROSINE RESIDUES WITHIN ACIDIC MOTIFS OF POLYPEPTIDES.

-!- CATALYTIC ACTIVITY: 3'-phosphoadenylylsulfate + protein tyrosine-0-sulfate.

adenosine 3',5'-bisphosphate + protein tyrosine-0-sulfate.

-!- SUBCELLULAR LOCATION: Type II membrane protein. Golgi membrane (

-!- FUNCTION: THE PYRUVATE DEHYDROGENASE COMPLEX CATALYZES THE OVERALL CONVERSION OF PYRUVATE TO ACETYL-COA & CO(2). IT CONTAINS MULTIPLE CONVERSION OF PYRUVATE TO ACETYL-COA & CO(2). IT CONTAINS MULTIPLE CONVERSION OF PYRUVATE COMPONENTS: PYRUVATE DEHYDROGENASE (E1), DIHYDROLIPOAMIDE ACETYLTRANSFERASE (E2) & LIPOAMIDE DEHYDROGENASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               on

A57397
chondroitin 6-sulfotransferase (EC 2.8.2.17) pre
C; Species: Gallus gallus (chicken)
C; Date: 23-Feb-1996 #sequence_revision 23-Feb-19
C; Accession: A57397
R; Fukuta, M.; Uchimura, K.; Nakashima, K.; Kato,
J. Biol. Chem. 270, 18575-18580, 1995
A; Title: Molecular cloning and expression of chi
A; Reference number: A57397; MUID:95355490
A; Accession: A57397
A; Status: preliminary
A; Molecule type: mRNA
A; Residues: 1-458 <FUK>
C; Superfamily: chondroitin 6-sulfotransferase
C; Keywords: sulfotransferase
